

## FULLSTACK DOTNET TUTORIAL

In this tutorial, we are going to build a full stack dotnet project, which is connected to a database and an HTML frontend

Let Start With The BACKEND

### STEP 1

- ➔ Create the project by using the visual studio code application
- ➔ Click on the [project>Manage nugget packages] to install the following packages
  1. Microsoft.EntityFrameworkCore
  2. Microsoft.EntityFrameworkCore.SqlServer
  3. Microsoft.EntityFrameworkCore.Design
  4. Microsoft.identity.Client
  5. Microsoft.Data.SqlClient
  6. Microsoft.SqlServer.Server
- ➔ To add CORS to your application, create a folder in the project root and name it Extensions
- ➔ Inside the Extensions folder, create a file and name it **ServiceExtensions.cs** and paste this code

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;

namespace ProjectManager.Extensions
{
    public static class ServiceExtensions
    {
        public static void ConfigureCors(this IServiceCollection services) =>
        services.AddCors(options =>
        {
            options.AddPolicy("CorsPolicy", builder =>
            builder.AllowAnyOrigin()
            .AllowAnyMethod()
            .AllowAnyHeader());
        });

        public static void ConfigureIISIntegration(this IServiceCollection services) =>
        services.Configure<IISSOptions>(options =>
        {
        });
    }
}
```

- ➔ In the Program.cs, add ConfigureCors and ConfigureIISIntegration as a service and also register the CORS in the Program.cs file. In the Program.cs, we need to call the DataContext in it too like this [builder.Services.AddDbContext<DataContext>();]

The entire **Program.cs** should look like this

```
using Microsoft.AspNetCore.HttpOverrides;
using ProjectManager.Data;
using ProjectManager.Extensions;

var builder = WebApplication.CreateBuilder(args);

// Add services to the container.

builder.Services.ConfigureCors();
builder.Services.ConfigureIISIntegration();

builder.Services.AddControllers();
// Learn more about configuring Swagger/OpenAPI at https://aka.ms/aspnetcore/swashbuckle
builder.Services.AddEndpointsApiExplorer();
builder.Services.AddSwaggerGen();
builder.Services.AddDbContext<DataContext>();

var app = builder.Build();

if (app.Environment.IsDevelopment())
    app.UseDeveloperExceptionPage();
else
    app.UseHsts();

// Configure the HTTP request pipeline.
if (app.Environment.IsDevelopment())
{
    app.UseSwagger();
    app.UseSwaggerUI();
}

app.UseDefaultFiles();
app.UseStaticFiles();
app.UseForwardedHeaders(new ForwardedHeadersOptions
{
    ForwardedHeaders = ForwardedHeaders.All
});
app.UseCors("CorsPolicy");

app.UseHttpsRedirection();

app.UseAuthorization();

app.MapControllers();
```

```
app.Run();
```

## Step 2

In the Root folder, create 2 folders, Models and Data

In the Models folder create this Four Models

### Project.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;

namespace ProjectManager.Models
{
    public class Project
    {
        public int Id {get; set;}
        public string name {get;set;}
        public string description {get;set;}
        public DateTime dueDate {get;set;}
        public double cost {get;set;}
        public string developer {get;set;}
        public string customer {get;set;}
        public string status {get;set;}
    }
}
```

### User.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;

namespace FlexiSecure.Models
{
    public class User
    {
        public int Id { get; set; }

        public string Name { get; set; } = string.Empty;
        public string Email { get; set; } = string.Empty;
        public byte[] PasswordHash { get; set; } = new byte[32];
        public byte[] PasswordSalt { get; set; } = new byte[32];
        public string? VerificationToken {get; set; }
        public DateTime? VerifiedAt { get; set; }
    }
}
```

```

public string? PasswordResetToken { get; set; }
public DateTime? ResetTokenExpires{get; set; }

}
}

```

### **UserRegisterRequest.cs**

```

using System;
using System.Collections.Generic;
using System.ComponentModel.DataAnnotations;
using System.Linq;
using System.Threading.Tasks;

namespace FlexiSecure.Models
{
    public class UserRegisterRequest
    {
        [Required,MinLength(3, ErrorMessage ="Enter a valid name")]
        public string Name { get; set; } = string.Empty;
        [Required, EmailAddress]
        public string Email { get; set; } = string.Empty;
        [Required, MinLength(6,ErrorMessage ="Please enter at least 6 characters ")]
        public string Password { get; set; } = string.Empty;
        [Required, Compare("Password")]
        public string ConfirmPassword{get; set; } = string.Empty;

    }
}

```

### **UserLoginRequest.cs**

```

using System;
using System.Collections.Generic;
using System.ComponentModel.DataAnnotations;
using System.Linq;
using System.Threading.Tasks;

namespace FlexiSecure.Models
{
    public class UserLoginRequest
    {

        [Required, EmailAddress]
        public string Email { get; set; } = string.Empty;
        [Required]
        public string Password { get; set; } = string.Empty;

    }
}

```

```
}
```

In the Data folder, Create a **DataContext.cs** file and paste this content

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using FlexiSecure.Models;
using Microsoft.EntityFrameworkCore;
using ProjectManager.Models;

namespace ProjectManager.Data
{
    public class DataContext : DbContext
    {
        //Empty constructor
        public DataContext(): base(){
        }

        //Database Connection String
        protected override void OnConfiguring(DbContextOptionsBuilder optionsBuilder)
        {
            base.OnConfiguring(optionsBuilder);
            optionsBuilder.UseSqlServer("Server=localhost,1433;Database=Projects;User=sa;Password=HydotTech;TrustServerCertificate=true;");
        }

        //Data Set, where Project and User are models in the Model folder
        public DbSet<Project> Projects => Set<Project>();
        public DbSet<User> Users => Set<User>();

    }
}
```

## Step 3

Open the Controller Folder and Create 2 Controllers,

### ProjectController.cs

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using Microsoft.EntityFrameworkCore;
using ProjectManager.Data;
using ProjectManager.Models;

namespace ProjectManager.Controllers
{
    [ApiController]
    [Route("api/Projects")]
    public class ProjectController : ControllerBase
    {
        private readonly DataContext _context;
        public ProjectController(DataContext context){
            _context = context;
        }
        [HttpPost()]
        public async Task<IActionResult> AddProject(Project project){
            //Call the Project.cs model to create a skeleton
            var my_project = new Project{
                name = project.name,
                description = project.description,
                dueDate = project.dueDate,
                cost = project.cost,
                developer = project.developer,
                customer = project.customer,
                status = project.status
            };
            _context.Projects.Add(my_project);
            await _context.SaveChangesAsync();
            return Ok("Projects Created Successfully");
        }
        [HttpGet()]
        public async Task<ActionResult<IEnumerable<Project>>> GetItems()
        {
            var items = await _context.Projects.ToListAsync(); // Replace "YourModels" with
            your actual DbSet name

            return Ok(items);
        }
        [HttpGet("{Id}")]
        public async Task<ActionResult<Project>> GetItem(int Id){
```

```

var item = await _context.Projects.FindAsync(Id);
if (item == null){
return NotFound();
}
return Ok(item);

}

```

```

[HttpPut("{id}")]

```

```

}
}
return NoContent();
}
private bool ItemExists(int id)
{

#### Step 4

Ensure that the Database is running in Docker or any place. To create a Database in Docker, follow this tutorial

#### Adding Database

Follow this link to create a database sql server using docker in Mac Os

<https://builtin.com/software-engineering-perspectives/sql-server-management-studio-mac>

In the terminal, install dotnet-ef tool by running this command [dotnet tool install --global dotnet-ef]

Migrate the DbContext by running the command [dotnet ef migrations add Initial ]

This will create a migration folder in the root folder

Also run the command to push the migration to the database [dotnet ef database update ]

Install Azure Data Studio and Connect it to the Database you have created

**server:** *localhost*

**Username:** *sa*

**Password:** *YourPassword*

Run The Application By Typing [dotnet watch run]

# LET DIVE INTO THE FRONTEND

## Step 1

Open the launchSettings.json file from the Properties folder in the root folder and delete the **"launchUrl": "Swagger"** line so that the application will open the default index.html file.

The launchSettings.json file should look like this

```
{
  "$schema": "https://json.schemastore.org/launchsettings.json",
  "iisSettings": {
    "windowsAuthentication": false,
    "anonymousAuthentication": true,
    "iisExpress": {
      "applicationUrl": "http://localhost:29732",
      "sslPort": 44348
    }
  },
  "profiles": {
    "http": {
      "commandName": "Project",
      "launchBrowser": true,
      "applicationUrl": "http://localhost:5217",
      "environmentVariables": {
        "ASPNETCORE_ENVIRONMENT": "Development"
      },
      "dotnetRunMessages": true
    },
    "https": {
      "commandName": "Project",
      "launchBrowser": true,
      "applicationUrl": "https://localhost:7273;http://localhost:5217",
      "environmentVariables": {
        "ASPNETCORE_ENVIRONMENT": "Development"
      },
      "dotnetRunMessages": true
    },
    "IIS Express": {
      "commandName": "IISExpress",
      "launchBrowser": true,
      "environmentVariables": {
        "ASPNETCORE_ENVIRONMENT": "Development"
      }
    }
  }
}
```

Create a folder called **wwwroot**, inside this folder, create the css, image and js folders

Outside the wwwroot folder, which is the root of the application, create the index.html

inside the index.html file, paste this code

```
<!DOCTYPE html>
<html lang="en">
<head>
<meta charset="UTF-8">
<meta http-equiv="X-UA-Compatible" content="IE=edge">
<meta name="viewport" content="width=device-width, initial-scale=p">
